

**AMENDMENTS TO THE SPECIFICATION**

Please make the following change to the last partial paragraph of page 1 through the first partial paragraph of page 2:

Medical procedures involving implantation of replacement tissue and devices have unique product supply requirements. For live tissue, there are supply issues including locating donors and keeping donated tissue alive, delivering and inventorying live tissue, as well as determining criteria for use of the tissue in a living patient. For this and other types of implants and tissue, there are further issues concerning size, shape, availability, surgical techniques, and, after implantation, monitoring. Finally, there are sales, accounting, and government regulatory reporting requirements. While many systems exist which address these issues, none provide an integrated solution which supports the user in the field, typically a sales/marketing representative or a representative of a provider of implant/tissue services.

On page 11 please update the bulleted list with the following:

- Products 11 - product selection menu organized by product type
- Inventory 13 - inventory selection menu that comprises: List, Receive, Release, Reconcile and Read Bar Code
- Synchronize 14 - synchronize pending information
- Camera 15

- Measurement System 16 - interface to an implementation of a measurement system, as described in U.S. Patent No. 5,832,422, which allows precise measurements to be obtained from images such as x-rays, CT/MRI scans, or directly on Patient
- Options 17
- Supplier Message 18 - broadcasted messages from a supplier
- Help ~~15~~ 19
